

Linux System and Its Application

Student ID: 312023704026

Name: Adam Baha

Date: Apr 12 2026

Lab4 vim tutorial

□ Objective

- Understand the basis of vi/vim editor
- Be able to editor text using vi/vim editor
- Be able to use vi/vim commands

□ Lab Environment

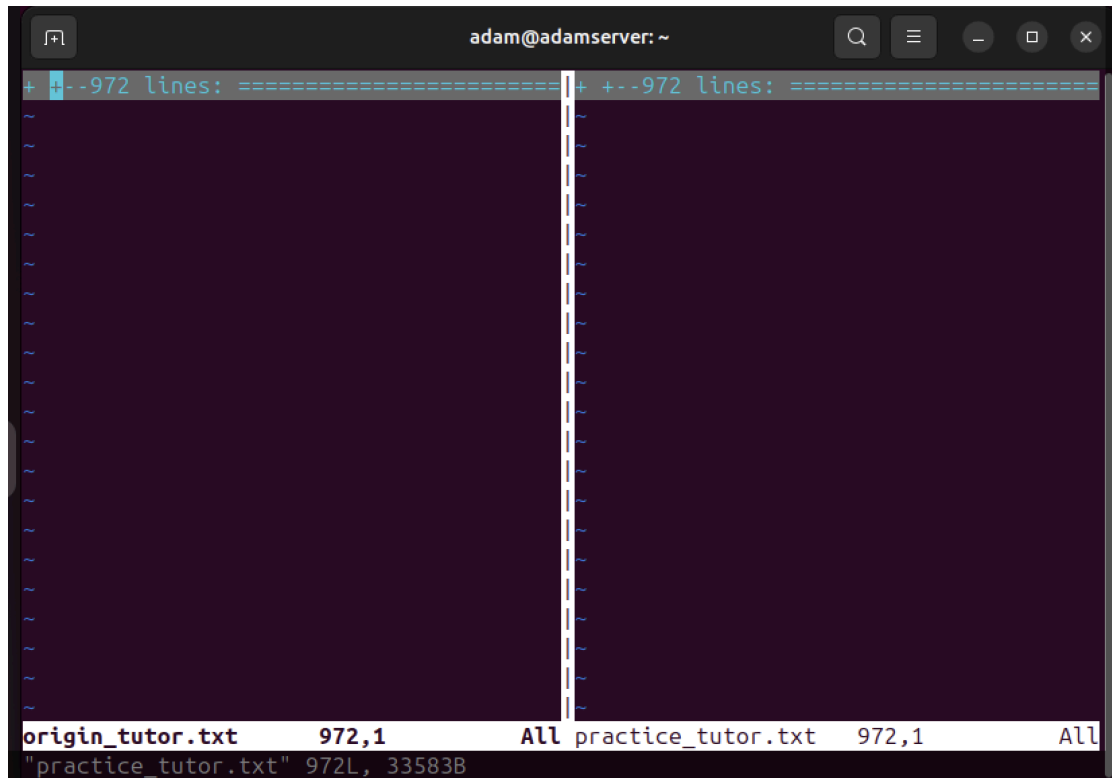

- Recommended: Ubuntu Desktop 24.04
- The other Linux or Unix-like environment

□ Instructions

- Login to **the account of your student id**. Use screenshot to show that you finish a specific task by paste it right below the tasks (**The screenshot should contain your student id**).
- Write answers to the questions related to each task right below the question.
- Once you finished, you should rename the current file name “Linux2026_lab4_STUID.docx” (**STUID should be changed to your own student id**) and then submit it to the Chaoxing system before 12th April.

□ Tasks

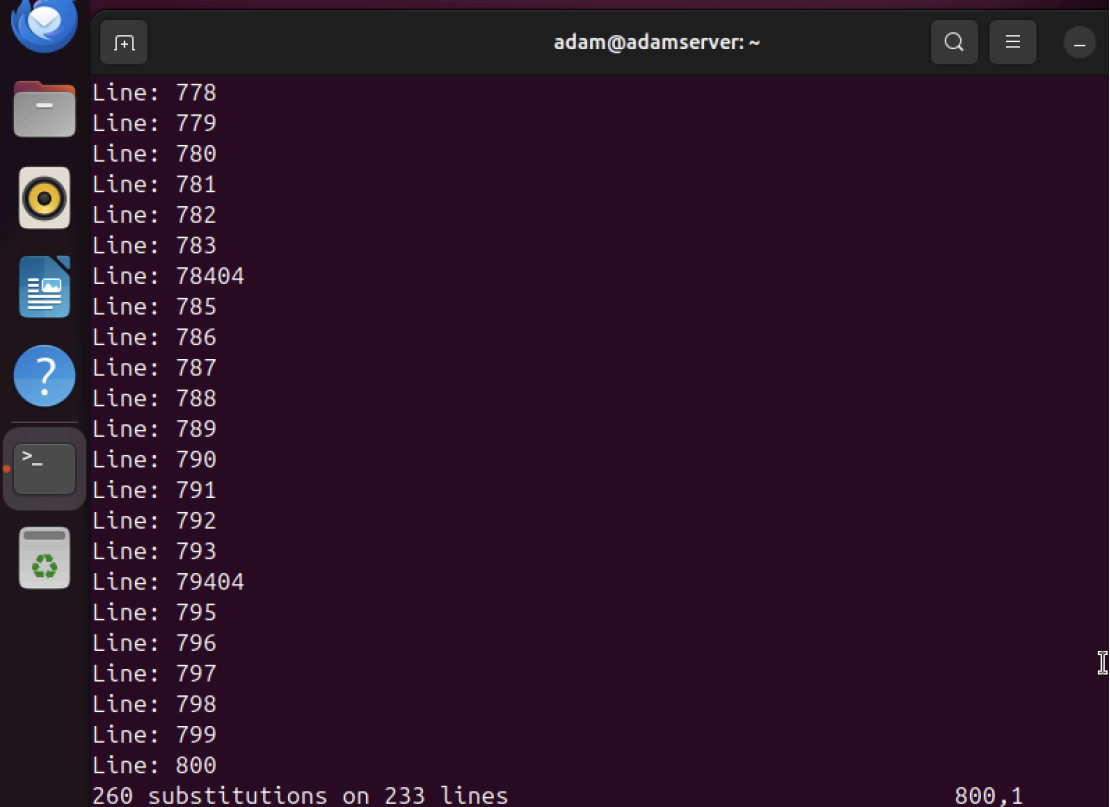

1. In your terminal, run the command 'vimtutor'. (If you haven't installed vim, run 'sudo apt install vim' first)
 - 1) Before modifying anything, save a clean copy of the tutorial to your current directory by typing ":w origin_tutor.txt" inside vim.
 - 2) Make another copy named "practice_tutor.txt" in your terminal.
 - 3) Open "practice_tutor.txt" with vim and complete Lesson 1, Lesson 2 and Lesson 3. Save and exit.
 - 4) In the terminal, use the command "vim -d origin_tutor.txt practice_tutor.txt". Take screenshots showing the split-screen comparison with the differences you made.
 - 5) Finish the rest Lessons by yourself.

2. Create a new file named "data_seq.txt". Using Vim macros (as discussed in the lecture, hint: <C-a> increments numbers), generate a list of numbers from 1 to 800 (ensure the file has exactly 800 lines, with each line containing one number).

Write down the exact Vim keystrokes/commands you used for the following tasks in the underline. And take a screenshot of the file content after completing ALL tasks:

- Jump directly to the 405th line: `405G`
- Delete all lines from current cursor position to the end: `dG`
- Jump back to the first line: `gg`
- Copy the first 5 lines and paste them at the end: `5yyGp`
- Delete lines from 15 to 400 inclusive: `:15,400d`
- Replace every '4' with '404' throughout the file: `:%s/4/404/g`
- Add "Line: " at the beginning of each line: `:%s/^/Line: /`

260 substitutions on 233 lines 800,1
```

3. Create a new text file containing only this single line:

10 - Linux Practice

Using a single Vim macro, can you transform this file into the following 6-line content? (Hint: You can pass a count to <C-a> to increment by more than one) Please write down the exact keys you pressed to record and execute the macro.

10 - Linux Practice

20 - Linux Practice

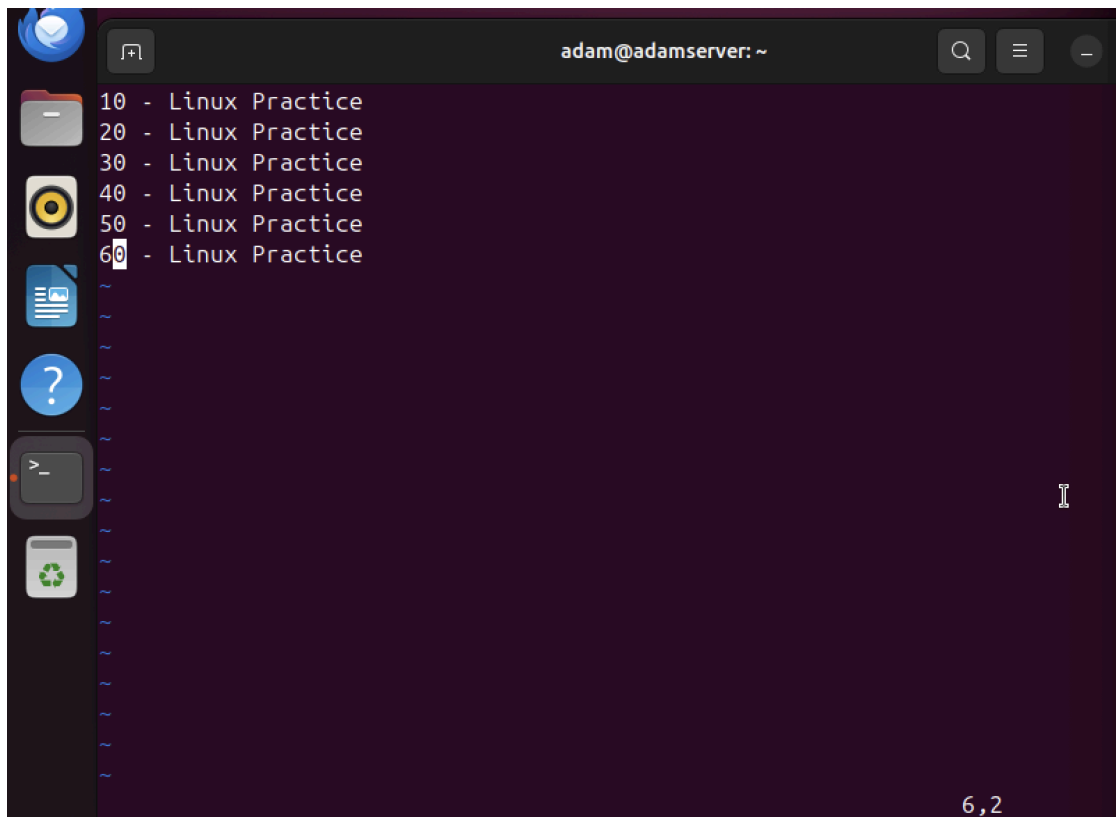

30 - Linux Practice

40 - Linux Practice

50 - Linux Practice

60 - Linux Practice

qa yyp 10 Ctrl+a q 4@a
